ProductPilot Demo Script — CrunchBite Digital Ordering Platform

Time: ~8 minutes end-to-end
Audience: Product managers, engineering leads, QSR/retail prospects
Mode: Demo provider (no API key required)
Differentiator vs healthcare demo: Multi-channel COTS integration (Oracle MICROS, Adyen, Otter, Braze, Epson KDS), real-time 86-ing propagation, loyalty programme complexity

---

Before You Start

Have this folder open in a file browser for drag-and-drop uploads.

File	Used as	Upload to
`domain-context.md`	Business domain knowledge	Domain Context — text or file upload
`technical-context.md`	Microservices + COTS architecture	Tech Context — text or file upload
`customer-journey.md`	Guest and operator journey maps	Domain Context — file upload
`compliance-and-ops.md`	PCI, FDA labelling, SLAs	Domain Context — file upload
`requirements-prompt.md`	Requirements text to paste	Requirements Intake screen

Step 1 — Configure Domain Context (~1 min)

1. Open Settings → confirm provider is **Demo**
2. Set Assistance Level to **Balanced**
3. Paste `domain-context.md` contents into the Domain Context text area
4. Drag `customer-journey.md` and `compliance-and-ops.md` into the file upload zone

> *"This is a QSR chain — 1,000 stores, 2.4 million transactions a day. The domain context tells the platform about CrunchRewards loyalty tiers, the 60-second 86-item propagation SLA, Oracle MICROS integration, delivery via Otter middleware. These constraints will show up in acceptance criteria without us having to spell them out in the requirements."*

Step 2 — Configure Tech Context (~45 sec)

1. Click Tech Context
2. Paste `technical-context.md` (or upload the file)

> *"The architecture here is interesting — it's a mix of custom microservices (Order Service, Loyalty Service, Kitchen Service) and major COTS products: Oracle MICROS POS, Adyen for payments, Braze for loyalty campaigns, Otter for delivery aggregation, Epson KDS hardware.*

> *The tech context tells the platform these service names so they appear in story acceptance criteria."*

Step 3 — Requirements Intake (~1 min)

1. Paste the requirements text from `requirements-prompt.md`
2. Click **Analyse / Start**

> *"This covers multi-channel ordering (mobile, web, kiosk, delivery), menu management including daypart and 86-ing, CrunchRewards loyalty, kitchen operations with KDS integration, payments via Adyen, and franchise dashboards. Realistic product brief for a mid-market QSR digital programme."*

Step 4 — Clarifying Questions (~1.5 min)

Walk through 2–3 questions. Suggested answers:

- **Primary users**: "Consumers (guests + loyalty members), store managers, franchise owners, kitchen staff"
- **Key integrations**: "Oracle MICROS POS, Adyen, Otter (Uber Eats + DoorDash), Braze, Epson KDS, Infor ERP for menu PIM"
- **Real-time requirements**: "86-item propagation ≤ 60 seconds across all channels; KDS ticket within 3 seconds of order placed"
- **Phasing**: "Phase 1: mobile, web, kiosk, loyalty, payments in 6 months; Phase 2: franchise dashboards, catering, drive-through LPR"

Slider demo (optional):

- Set to **Streamlined** → "Skip questions entirely — good for a team that already has a defined product brief"
- Reset to **Balanced** → proceed

Step 5 — Epics (~1.5 min)

AI generates 5–7 epics. Expected: Multi-Channel Ordering, Menu Management & 86-ing, CrunchRewards Loyalty, Kitchen Operations & KDS, Payment Processing, Franchise & Store Management, Delivery Integration.

> *"Notice how the epics map directly to the integration landscape — there's a dedicated Kitchen Operations epic because the KDS real-time constraint was prominent in the domain context. And Delivery Integration is its own epic because the Otter middleware has specific acknowledgement SLAs."*

Point out:

- Phase 1 / Phase 2 labels on epics reflecting the phasing from Q&A
- Tags referencing MICROS, Adyen, Braze, KDS — the COTS products

Click **Generate Stories** on **Menu Management & 86-ing**.

Step 6 — Story Breakdown (~2 min)

Walk through 2–3 stories:

1. **86 an item from store manager app** — point out the 60-second propagation SLA in AC, the Kafka `item.86d` event, reference to Menu Service cache invalidation
2. **Display allergen info on kiosk** — point out FDA labelling requirement from the compliance doc appearing in AC, reference to Infor PIM as the source
3. Click **Generate Stories** on **CrunchRewards Loyalty** to show the loyalty programme complexity: 24-hour fraud hold, single-offer-per-order rule, Braze offer validation

> *"This is what makes the context investment worthwhile. The story for 'Apply loyalty offer at checkout' knows about the 24-hour point hold, the one-offer-per-order rule, and references the Loyalty Service and Payment Service by name. Without context those would be generic placeholders."*

Show story editing:

- Click **Split Story** on a larger story → AI sub-divides it
- Show **INVEST validation** on a story with multiple concerns → fix suggestion referencing the 60-second SLA

Step 7 — INVEST Validation (~45 sec)

Click the **Validate** tab on a complex story (e.g., "Propagate item unavailability to all channels").

> *"The validator calls out that this story is too large — it crosses three services (Menu Service, Delivery Gateway, MICROS) and should be split by channel. It's caught the cross-service coupling that would cause integration headaches in the sprint."*

- Click **Fix with AI** → revised story focuses on one channel; AC references the 60-second SLA

Step 8 — Export (~30 sec)

Export as **CSV** or **JIRA JSON**.

> *"Backlog ready for sprint planning. The MICROS integration stories, the Adyen payment stories, the KDS ticket delivery stories — all with acceptance criteria that reference the right services and SLAs. A BA and a tech lead could've spent two sprints getting here."*

Key Talking Points

Point	Evidence in demo
COTS product awareness	Oracle MICROS, Adyen, Braze, Epson KDS, Otter appear in story AC by name
Real-time SLA in stories	60-second 86-propagation, 3-second KDS ticket, 3-second Otter ACK in AC

Compliance in stories	FDA allergen display, PCI SAQ-A scope, CCPA data deletion appear in relevant stories
Multi-channel complexity	Separate stories per channel for 86-ing — AI spotted the cross-service coupling
Loyalty nuance	24-hour fraud hold, single offer per order, Braze integration in loyalty stories
Franchise multi-tenancy	Franchise Portal BFF stories reference data isolation between franchise owners
