CrunchBite Digital — Customer & Operator Journey Map

Document type: UX Research / Business Analysis
Version: 1.3
Owner: CrunchBite Digital Product Team

Overview

This document maps the primary journeys across both customer-facing and operator-facing touchpoints of the CrunchBite digital platform. It is the reference for story derivation, acceptance criteria definition, and sprint prioritisation.

Journey 1 — Mobile Order-Ahead (Loyalty Member)

Persona: Priya, 28, commuter, Gold-tier CrunchRewards member

Goal: Order her usual on the way to the office; earn points and apply a personalised offer.

Step	Action	Service	Business rule
1	Opens CrunchBite app; biometric login	Identity Service	Session valid 30 days on trusted device
2	"Reorder" taps her saved favourite	Menu Service	Menu Service checks daypart — items available for current time slot
3	Offer banner shows "Free drink with any combo"	Loyalty Service	Offer personalised via Braze; validated against expiry and single-use flag
4	Applies offer; sees discount in cart	Loyalty Service	Only one offer per order; offer held (not consumed) until payment succeeds
5	Selects pickup store and 15-minute lead time	Order Service	Store Config Service confirms store is open and item is not 86'd
6	Pays with saved card (Adyen network token)	Payment Service	3DS2 not required — recurring token above $25 exempt via MIT exemption
7	Order placed; Notification Service sends push	Notification Service	Push within 5 seconds of order confirmation
8	MICROS POS receives order; KDS ticket fires	Kitchen Service	KDS ticket within 3 seconds of order placed event on Kafka
9	Order ready; push notification sent	Notification Service	Order Service emits `order.ready` event; Notification Service reacts
10	Priya collects; points posted after 24h hold	Loyalty Service	24-hour fraud hold before points visible in account

Acceptance criteria to derive:

- Menu Service must validate daypart and 86-status at order time (not at browsing time)
- Offer held atomically at checkout; consumed only on payment success; released on payment failure
- KDS ticket must include modifier details and any allergy flags on the line item
- `order.ready` push notification must arrive within 10 seconds of kitchen bump

---

Journey 2 — Kiosk Ordering (Unauthenticated Guest)

Persona: Marcus, 45, walk-in customer, no loyalty account

Goal: Order lunch from the in-store kiosk quickly; pay by card tap.

Step	Action	Service	Note
1	Approaches kiosk; attract screen shown	Kiosk app (local)	60-second idle reset
2	Taps "Start Order"	Menu Service (cached)	Menu loaded from local SQLite cache (≤ 60 s old)
3	Browses All-Day menu; allergen info visible	Menu Service	FDA menu labelling — calories on menu, allergen on item detail
4	Adds Signature Burger + large fries; upsell prompt shown	Order Service	AI suggestive sell from Store Config (drinks upsell with burgers)
5	Taps card on Adyen terminal	Payment Service	Adyen Terminal API; card data never touches kiosk app
6	Receipt printed; order sent to MICROS and KDS	Order Service → Kitchen Service	MICROS is authoritative receipt and tax engine
7	Kiosk resets to attract screen	Kiosk app	30-second soft prompt then reset

Kiosk offline scenario (critical path):

- Network drops during step 2: kiosk serves cached menu; order placed locally
- Payment attempted: Adyen Terminal API offline → card tap still works (terminal has offline auth capability)
- Order queued locally; synced to Order Service + MICROS when network recovers (within 5 minutes)
- Staff alerted on expediter screen if order sync delayed > 3 minutes

Acceptance criteria to derive:

- Kiosk must load and display menu with no network for ≥ 5 minutes using local SQLite cache
- Allergen summary must appear on every item detail screen (not just on request)
- Adyen terminal offline auth must be supported; orders queued in kiosk local store
- MICROS sync failure must alert store manager on the admin dashboard within 1 minute

---

Journey 3 — 86-Item Emergency (Store Manager)

Persona: Damian, store manager, corporate store

Goal: Mark the Spicy Chicken Sandwich unavailable during the lunch rush; prevent orders already in flight from failing.

Step	Action	Service	SLA
1	Opens Store Manager app on tablet	Store Config Service	—
2	Navigates to "Menu → Item Availability"	Menu Service	—
3	Marks "Spicy Chicken Sandwich" as 86'd	Menu Service	Kafka event `item.86d` emitted within 1 second
4	Mobile app, web, kiosk show item greyed out	Menu Service → all channels	≤ 60 seconds end-to-end
5	MICROS POS updated via MICROS REST API	Menu Service → MICROS	≤ 60 seconds
6	Otter (delivery) updated; item removed from aggregator menu	Delivery Gateway → Otter	≤ 60 seconds
7	Orders already in-flight with the item: Damian sees alert	Order Service	Orders placed before 86 are not cancelled automatically
8	Damian decides to fulfil existing orders; marks item back available when stock replenished	Menu Service	Re-availability propagates via same Kafka event

Acceptance criteria:

- `item.86d` Kafka event must reach Menu Service cache invalidation within 1 second
- All consumer channels must reflect unavailability within 60 seconds (measured by E2E test)
- Orders placed before 86-event are not auto-cancelled; flagged to manager for decision
- Store Manager UI must show the count of in-flight orders containing the 86'd item

---

Journey 4 — Franchise Owner Dashboard

Persona: Linda, franchise owner of 8 CrunchBite stores

Goal: Review yesterday's performance before her morning franchisee call with the FBC.

Step	Action	Service
1	Logs in to Franchise Portal	Identity Service (Cognito, franchisee pool)
2	Dashboard loads multi-store roll-up	Franchise Portal BFF → Analytics Service
3	Sees SOS (speed-of-service) average per store	Analytics Service (Snowflake / Kafka)
4	Clicks into store with SOS > 4 min	Analytics Service
5	Sees item-level breakdown: fry station causing delay	Analytics Service

6	Exports CSV report for FBC meeting	Franchise Portal BFF

Key metrics displayed:

- Total transactions, net sales, average check, by store and roll-up
- Speed-of-service: average and p90 per hour, per store
- Top 10 items by volume; slow movers
- Loyalty redemption rate
- Void and refund rate (with drill-down by manager)

Acceptance criteria:

- Franchise Portal BFF must aggregate data across all stores owned by the authenticated franchise owner only (no cross-franchise data leakage)
- Dashboard data must reflect previous day's complete data (Snowflake updated by 06:00 local)
- CSV export must include store name, date range, all KPIs on the dashboard
- FBC users see all stores in their territory (multi-franchise roll-up)

Journey 5 — Delivery Order (Uber Eats customer)

Persona: James, ordering CrunchBite via Uber Eats app — not a CrunchBite member

Goal: Lunch delivery; never interacts with CrunchBite systems directly.

Step	Action	Service	Note
1	Browses CrunchBite menu on Uber Eats	Otter (not CrunchBite)	Menu synced to Uber Eats via Otter
2	Places order on Uber Eats	Otter webhook → Delivery Gateway	Otter sends webhook within 2 s of order placement
3	Delivery Gateway acknowledges Otter webhook	Delivery Gateway	Must ACK within 3 s or Otter retries
4	Order injected into MICROS POS as type `DELIVERY`	Order Service → MICROS	Treated identically to native mobile order in kitchen
5	KDS ticket fires for kitchen	Kitchen Service	Same SOS targets apply
6	Uber Eats driver arrives; order handed off	—	CrunchBite has no further system interaction
7	Order marked `COLLECTED` in Order Service	Order Service	Triggers Analytics event for SOS reporting

86-item delivery sync:

- When a store 86's an item, Otter must be notified within 60 seconds via Delivery Gateway
- Otter removes item from Uber Eats / DoorDash menu listing in their system
- Orders already accepted by aggregator before the 86 propagated: fulfilment decision by store manager

---

Emotional Journey Summary

Journey	High point	Low point	Opportunity
Mobile order-ahead	"Done in 30 seconds; points applied"	Offer not applying due to already-used status	Real-time offer validity indicator before checkout
Kiosk	"Fast; no queue"	Network dropout → uncertainty whether order went through	Clear "Offline — order saved" indicator on kiosk screen
86-item (manager)	"One tap and it's gone from every channel"	Unsure if in-flight orders are affected	Immediate count of affected in-flight orders in the alert
Franchise dashboard	"One view of all 8 stores"	Data is yesterday's — can't see today's lunch rush live	Near-real-time Kafka-fed dashboard for Phase 2
Delivery	Seamless kitchen integration	Item mismatch between Otter menu and in-store 86	Faster Otter menu sync; webhooks instead of polling
