HealthConnect — Patient Journey Map

Document type: UX Research / Business Analysis
Version: 2.1
Last reviewed: Q1 2026
Owner: HealthConnect Product Team

Overview

This document maps the end-to-end journeys of a registered patient across the five primary touchpoints of the HealthConnect patient portal. It is intended to inform story writing, acceptance criteria, and prioritisation.

Journey 1 — First-Time Registration and Identity Verification

Persona: Sarah, 42, managing a chronic condition

Goal: Create a portal account and link it to her existing Meridian Health patient record.

Step	Action	System	Outcome	Pain point today
1	Visits portal URL from appointment reminder letter	Browser	Landing page loads	Letter URL is hard to remember
2	Clicks "Create Account"	Auth Service	Registration form shown	—
3	Enters name, email, date of birth, MRN number	Auth Service	Identity checked against Epic	Unclear error if MRN format is wrong
4	Receives SMS OTP for MFA setup	Twilio	OTP verified	Doesn't know SMS is coming
5	Sets password and accepts terms	Auth Service	Account created; Cognito record linked to MRN	Terms are too long
6	Lands on dashboard	Patient App	Upcoming appointments visible	No onboarding tour

Acceptance criteria to derive:

- Identity verification must match DOB + MRN against Epic Patient resource before account creation
- MFA must be set up before first login completes
- Clear error messages for each failure mode (MRN not found, DOB mismatch, duplicate account)
- Onboarding checklist widget on first-login dashboard

Journey 2 — Booking a GP Appointment

Persona: David, 67, retired, books appointments for himself and his wife (proxy)

Goal: Book a face-to-face GP slot within the next 2 weeks.

Step	Action	System	Outcome
1	Logs in; sees appointment widget	Patient App	—
2	Selects "Book GP Appointment"	Appointment Service	Available slots fetched from Epic via FHIR
3	Filters by preferred GP and date range	Appointment Service	Slot grid rendered
4	Selects a slot and confirms	Appointment Service	Booking written to Epic; confirmation email sent
5	Receives email + SMS confirmation	SendGrid / Twilio	—
6	Receives reminder 24 h before	Notification Service	—
7	Receives reminder 2 h before	Notification Service	—

Business rules in scope:

- Patient may not hold more than 3 future bookings for the same clinic simultaneously
- Cancellation within 2 hours of the slot triggers a no-show flag in Epic via FHIR write-back
- Slot availability is cached in Redis for 60 seconds; live re-check on confirmation

Edge cases:

- Slot taken between selection and confirmation → show next available slot, do not double-book
- Patient has 3 existing bookings → block booking and show count + option to cancel an existing one
- GP becomes unavailable after booking → Notification Service sends rescheduling prompt

---

Journey 3 — Viewing Lab Results and Downloading Records

Persona: Sarah (same as Journey 1)

Goal: Check her latest blood panel results that her GP ordered last week.

Step	Action	System	Outcome
1	Navigates to "My Health" → "Lab Results"	Patient App	Results list loaded from FHIR Adapter cache
2	Selects the most recent panel	FHIR Adapter	`DiagnosticReport` resource fetched from Epic
3	Reads result values with reference ranges	Patient App	Out-of-range values highlighted

4	Taps "Download my records"	File Store	PDF generated server-side; pre-signed S3 URL issued (5 min TTL)
5	PDF opens in browser / saved to device	—	PHI access event logged to Audit Service

Acceptance criteria to derive:

- Lab results available within 4 hours of Epic verification
- Only results from the last 5 years displayed by default; older records available on request via admin
- Every view of a lab result must emit an audit event: patient MRN (tokenised), resource ID, timestamp, IP
- Download PDF must include the Meridian Health branding header and result reference ranges
- Pre-signed URL must expire after 5 minutes to prevent URL sharing

---

Journey 4 — Requesting a Repeat Prescription

Persona: Marcus, 55, on long-term blood pressure medication

Goal: Request a repeat prescription 10 days before his current supply runs out.

Step	Action	System	Outcome
1	Navigates to "Medications"	Prescription Service	Current medication list fetched from Epic `MedicationRequest`
2	Selects medication → "Request Repeat"	Prescription Service	Checks: not a controlled substance; ≥7 days before estimated run-out
3	Adds note to GP (optional)	Prescription Service	Request queued
4	Request submitted to GP inbox in Epic	FHIR Adapter	`MedicationRequest` resource created with `intent: refill-request`
5	GP reviews and approves in Epic	Epic EHR	Status updated to `active`
6	Patient notified via email	Notification Service	"Your prescription is ready for collection"

Business rules in scope:

- Request must be submitted at least 7 days before estimated run-out (calculated from days-supply on last dispense)
- Controlled substances (`MedicationRequest.category = controlled`) cannot be requested via portal — button hidden, explanatory message shown
- Patient receives SMS notification when GP approves or rejects

---

Journey 5 — Carer / Proxy Access Setup

Persona: Emma, 38, caring for her elderly father who lacks digital confidence

Goal: Get proxy access to her father's account to manage his appointments.

Step	Action	System	Outcome
1	Father logs into his account	Auth Service	—
2	Navigates to "Account" → "Manage Access"	Auth Service	Proxy access panel shown
3	Clicks "Add carer" and enters Emma's email	Auth Service	Invite email sent to Emma
4	Emma receives invite, creates own account	Auth Service	Emma's account created; pending consent
5	Father uploads signed consent form (scanned PDF)	File Store	Document stored in S3; admin notified
6	Admin reviews consent document in Admin Portal	Auth Service	Proxy relationship activated
7	Emma logs in; switches to father's profile	Patient App	Full proxy view of father's records

Acceptance criteria to derive:

- Proxy relationship not active until admin explicitly approves the scanned consent document
- Proxy can perform: view records, book/cancel appointments, send messages, view lab results
- Proxy cannot: change father's password, add further proxies, request controlled substances
- Proxy access audit log entries must record both the proxy MRN and the patient MRN
- Father can revoke proxy access at any time; immediate effect on next request

---

Emotional Journey Summary

Journey	High point	Low point	Opportunity
Registration	Account linked — "my data is here"	Confusing MRN format error	Clear inline format hint + example
Booking	Instant confirmation	Slot gone between selection & confirm	Optimistic lock + graceful retry
Lab results	"I can read my own results"	Medical jargon in result values	Lay-language tooltip per test type
Prescription	No more calling the surgery	Uncertainty about approval timeline	Real-time status tracker
Proxy setup	Relief — "I can help Dad"	Waiting for admin to approve document	Target: same-day admin review SLA
